![](_page_11_Figure_1.jpeg)

![](_page_11_Picture_4.jpeg)

![](_page_12_Picture_1.jpeg)

# **Production – Consumption**

![](_page_12_Picture_6.jpeg)

## This is easy

![](_page_12_Picture_8.jpeg)

Enlighten your Data – Satish Kale

![](_page_13_Figure_1.jpeg)

## Reality is more complex.

## Data is scattered all over.

![](_page_13_Picture_8.jpeg)

![](_page_13_Picture_9.jpeg)

![](_page_14_Figure_1.jpeg)

## Even more complex.

## There are multiple clients.

# **Production – Consumption**

![](_page_14_Picture_7.jpeg)

![](_page_14_Picture_8.jpeg)

# **Problem : Production – Consumption**

![](_page_15_Figure_1.jpeg)

And made available to various clients, interfaces and formats.

Data needs to be located, fetched, combined from various disparate sources

![](_page_15_Picture_7.jpeg)

![](_page_15_Picture_8.jpeg)

# Data Challenges Getting Bigger - Big Data, Cloud, and Mobile

Existing Data Integration approaches are not sufficient

- •Extracting and moving data adds latency and cost
- •Every project solves data access and integration in a different way
- •Solutions are tightly coupled to data sources
- Poor flexibility and agility

![](_page_16_Figure_6.jpeg)

![](_page_16_Picture_11.jpeg)

Inconsistent, Incomplete Information

How would your organization change...

- intermediary data tiers?
- If data could be repurposed quickly into new applications and business processes?
- needed, where needed and when needed?

# Consider...

Uninformed, Costly Business Risk **Delayed Decisions** and Exposure

• If data were readily reusable in place rather than requiring significant effort to build new

• If all applications and business processes could get all of the information needed in the form

![](_page_17_Picture_13.jpeg)

![](_page_18_Figure_1.jpeg)

And made available to various clients, interfaces and formats.

# **Back to the problem**

Data needs to be located, fetched, combined from various disparate sources

![](_page_18_Picture_8.jpeg)

![](_page_18_Picture_9.jpeg)

# **Solution Approach – Data Virtualization**

![](_page_19_Figure_1.jpeg)

## Decoupled Choice of connectivity, accessibility Flexible

![](_page_19_Picture_5.jpeg)

Enlighten your Data – Satish Kale

# What does Data Virtualization software do? **Turn Fragmented Data into Actionable Information**

Data Virtualization software virtually unifies data spread across various disparate sources; and makes it available to applications as a single consolidated data source.

The data virtualization software implements 3 steps process to bridge data sources and data consumers:

- **Connect**: Fast access to data from diverse data sources
- **Compose**: Easily create unified virtual data models and views by combining and transforming data from multiple sources.
- **Consume**: Expose consistent information to data consumers in the right form through standard data access methods.

![](_page_20_Figure_9.jpeg)

![](_page_20_Picture_10.jpeg)

# **Turn Siloed Data into Actionable Information**

![](_page_21_Figure_1.jpeg)

![](_page_21_Picture_4.jpeg)

![](_page_21_Picture_6.jpeg)

# JBoss Data Virtualization – Use Cases

## Self-Service Business Intelligence

The virtual, reusable data model provides business-friendly representation of data, allowing the user to interact with their data without having to know the complexities of their database or where the data is stored and allowing multiple BI tools to acquire data from centralized data layer. Gain better insights from Big Data using JBoss Data Virtualization to integrate with existing information sources.

360° Unified View

Deliver a complete view of master & transactional data in real-time. The virtual data layer serves as a unified, enterprise-wide view of business information that improves users' ability to understand and leverage enterprise data.

Agile SOA Data Services

A data virtualization layer deliver the missing data services layer to SOA applications. JBoss Data Virtualization increases agility and loose coupling with virtual data stores without the need to touch underlying sources and creation of data services that encapsulate the data access logic and allowing multiple business service to acquire data from centralized data layer.

## Regulatory Compliance

Data Virtualization layer deliver the data firewall functionality. JBoss Data Virtualization improves data quality via centralized access control, robust security infrastructure and reduction in physical copies of data thus reducing risk. Furthermore, the metadata repository catalogs enterprise data locations and the relationships between the data in various data stores, enabling transparency and visibility.

![](_page_25_Picture_6.jpeg)

## JBoss Data Virtualization Key Business Values

![](_page_26_Figure_1.jpeg)

Improved utilization of data assets
Derive more value from existing investments
Complements existing systems

Better/faster than hand coding
Faster, less costly than batch data movement
Data virtualization provides loose coupling

Right data at the right time to the right people
Decision support, BI with a complete view of information

Powerful security, Auditing, Data Firewall
Avoid data silo proliferation
Central data access and policy, Compliance

![](_page_26_Picture_8.jpeg)

## **JBoss Data Virtualization** Key Differentiators

![](_page_27_Figure_1.jpeg)

 Cost leadership lower adoption barrier • Core based subscription provide flexibility across small to large deployment

Open, community based innovation

Private, public and hybrid cloud deployments

 Integrated with JBoss Middleware portfolio for end-to-end business solution Single vendor support simplify IT operations

 Fast query processing optimizations, low footprint Comprehensive data provisioning options Quick data visualization through business dashboard

## JBoss Data Virtualization: Supported Data Sources

#### **Enterprise RDBMS:**

- Oracle
- IBM DB2  $\bullet$
- Microsoft SQL Server  $\bullet$
- Sybase ASE •
- MySQL  $\bullet$
- PostgreSQL •
- Ingres  $\bullet$

#### **Enterprise EDW:**

- Teradata
- Netezza  $\bullet$
- Greenplum •

#### Hadoop:

- Apache
- HortonWorks
- Cloudera
- More coming...

#### **Office Productivity:**

- Microsoft Excel
- Microsoft Access

- Mondrian
- MetaMatrix
- LDAP

Google Spreadsheets

**Specialty Data Sources:** ModeShape Repository

#### NoSQL:

- JBoss Data Grid
- MongoDB
- More coming...

#### **Enterprise & Cloud Applications:**

- Salesforce.com
- SAP

#### **Technology Connectors:**

- Flat Files, XML Files, XML over HTTP
- SOAP Web Services
- **REST Web Services** •
- OData Services

Defines transformations

![](_page_31_Picture_16.jpeg)

# **Rich Security Capabilities**

Multiple forms of Authentication:

- Client Authentication: LoginModules (File, LDAP); Kerberos (JDBC/ODBC); HTTP Basic, WS UsernameToken Profile (Web Services)
  - PassThrough Authentication
- Source Authentication: Source credentials, Caller Identity (same credentials as client), RoleBasedCredentialMap (credentials per role), Execution payload/Custom

Authorization:

- Create, Read, Update, Delete, Execute permissions
- Row-based security
- Column masking

Additional Security:

- Transport encryption (SSL: Anon, 1-way, 2-way)
- Password encryption

![](_page_32_Picture_18.jpeg)

## **Performance** Optimization Caching & Materialized View

Multiple levels of caching to meet performance requirements and manage load on source systems

- Materialized Views
  - External or Internal materialized views
  - Ability to override use of materialized views
- •Result set Caching
  - Applied to results return from user queries and virtual procedure calls
  - Configurable time to live and max. number of entries
- •Code Table Caching
  - Suited for integrating reference data with transaction/operational data e.g. Country code, State Code etc.

•Caching hints to set time-to-live, memory preference, and updatability

![](_page_33_Figure_13.jpeg)

![](_page_33_Picture_14.jpeg)

# A good segway into other aspect of "Enlighten"

#redhat #rhsummit

.

•

. . .

![](_page_34_Picture_3.jpeg)

## Performance

![](_page_35_Picture_0.jpeg)

- Make data light weight
  - -Reduce latency
  - -Improve performance
- Bring data closer to processing

# En-"lighten"

![](_page_35_Picture_8.jpeg)

![](_page_35_Picture_9.jpeg)

![](_page_35_Picture_12.jpeg)

# The challenge

### How do you design your application for:

- Performance during unprecedented transaction volumes?
- Availability to meet high uptime requirements?
- Flexibility in open hybrid cloud environments?
- Reliability to provide accurate, real-time information?
- Independence from the complex, rigid data-tier?

![](_page_36_Picture_9.jpeg)

![](_page_37_Picture_0.jpeg)

-----

#redhat #rhsummit

## **Solutions?**

![](_page_37_Picture_3.jpeg)

# Modern challenges, traditional solutions?

![](_page_38_Figure_1.jpeg)

Design for more...

- Pile on complex code, servers, databases, DBAs
- Cost-prohibitive
- Quick fix until you need to scale again

![](_page_38_Picture_8.jpeg)

## Start from scratch...

- Completely re-architect
- Sharding? Denormalization?
- Complicated
  - Time- and resource-intensive
  - Risky

![](_page_38_Picture_15.jpeg)

## How about a modern, agile approach? Develop a new application strategy with data grids

### The data grid solution:

- Handle high transactional throughput
- Meet strict performance requirements
- Meet high up-time requirements
- Streamline interactions with the traditional data tier

## Benefits:

- Cost-effective
- Linear scalability
- Eliminates single point of failure
- Low-latency, fault-tolerant
- Responsive, available, flexible, elastic
- Cloud- and virtualization-ready

![](_page_39_Picture_16.jpeg)

# What is a data grid?

- scalability
- Commonly a complementary layer to the relational database and the application.

### **Key data grid characteristics:**

- In-memory, distributed caching
- Elastic scalability
- Advanced querying
- Data replication
- Processing for streaming data
- Transaction capabilities

• An in-memory distributed data store designed for fast access to large volumes of data and

![](_page_40_Figure_14.jpeg)

![](_page_40_Picture_15.jpeg)

# Our Solution: Red Hat JBoss Data Grid

.....

#redhat #rhsummit

![](_page_41_Picture_2.jpeg)

# **RED HAT<sup>®</sup> JBOSS<sup>®</sup>** DATA GRID

### Fast access to data

- In-memory speeds, high availability, reliability, elasticity
- Built on proven, popular open source Infinispan technology

## **Flexibility beyond Java**

Compatible with Java and non-Java platforms

### Premium and advanced features in a costeffective subscription

- Includes Red Hat JBoss Operations Network Management for management tooling
- Includes remote clients

RED HAT JBOSS DATA GRID

> Client/Server and library modes

In-memory store

Persistent cache store

Red Hat Enterprise Linux

Windows, UNIX, and other Linux

![](_page_42_Picture_19.jpeg)

## **Red Hat JBoss Data Grid** Accomplish more...

### High availability to access data within and across datacenters

- Provide a complementary layer to the application and its relational store
- Meet data-retention requirements and up-time SLAs

Maintain fast response times with elastic scale

- Add or remove nodes using a straightforward process
- Data is distributed and replicated in the background

Designed for open hybrid cloud environments

- data grid
- Flexibility to deploy your data, your way
- Free up IT budget by avoiding vendor lock-in and licensing costs
- Deploy your data, your way with multiple protocols and a Java API
- Developer-friendly, compatible, adaptable technology

• Independent control over the lifecycle, maintenance and costs of the application, its database, and the

![](_page_43_Picture_19.jpeg)

### Red Hat JBoss Data Grid: Conceptual architecture

#redhat #rhsummit

![](_page_44_Picture_2.jpeg)

## **JBoss Data Grid conceptual architecture** Library mode

![](_page_45_Picture_1.jpeg)

![](_page_45_Picture_5.jpeg)

## **JBoss Data Grid conceptual architecture** *Client / server*

![](_page_46_Picture_1.jpeg)

![](_page_46_Picture_5.jpeg)

![](_page_46_Picture_7.jpeg)

![](_page_46_Picture_8.jpeg)

## **Conceptual architecture** Cache API

### **User application**

• End-user interface (i.e. web application, Java server application)

#### **Cache API**

• Uses memcached, Hot Rod, or REST APIs

![](_page_47_Picture_8.jpeg)

![](_page_47_Picture_9.jpeg)

# **Conceptual architecture**

L1 cache, cache and cache manager

![](_page_48_Picture_2.jpeg)

### L1 cache

- Stores remote cache entries after they are initially accessed
   Primary mechanism to retrieve a cache instance Flexible setup
- For fast retrieval and to prevent unnecessary remote fetch operations

#### Cache

Houses cache instances

### **Cache manager**

- One cache manager per process
- Multiple caches per cache manager
- One interface per cache

![](_page_48_Picture_14.jpeg)

# **Conceptual architecture**

L1 cache, cache and cache manager

![](_page_49_Picture_2.jpeg)

### **Cache configuration**

- Locking policy
- Transactions
- Eviction policy
- Expiration policy
- Persistence mechanism
- Backups
- L1 cache policy

### **Cache manager configuration**

- Name / Alias / JNDI
- Start-up policy
- Transport policies
- Caches

![](_page_49_Picture_18.jpeg)

![](_page_50_Picture_0.jpeg)

#### **Cache loader**

Ready-only interface – locate and retrieve data

#### **Cache store**

Cache loader with write capabilities

### **Persistent store**

 Permanent store for cache instances and entries (i.e. relational database, file system, etc...)

# **Conceptual architecture**

Cache store, cache loader, and persistent store

![](_page_50_Figure_11.jpeg)

![](_page_50_Picture_12.jpeg)

## **Conceptual architecture** The cache store

- Write-behind or write-through behavior
- A cache has one or more cache stores
- Cache stores can be chained
- Can be loaded or purged on start
- Open and supported API for custom stores
- File, JDBC, remote

![](_page_51_Figure_10.jpeg)
