

BOSTON, MA JUNE 23-26, 2015

JBoss Fuse to JBoss Data Virtualization Integration

Bill Kemp Kenny Peeples Cojan van Ballegooijen

June 24, 2015

#redhat #rhsummit

SUMMIT BY DAY PARTY BY NIGHT CLICATION SUMMIT OPENSHIFT RED HAT MO

JOIN OUR **JBOSS, OPENSHIFT,** AND **MOBILE** TEAMS ON WED. JUNE 24 FOR A NIGHT OF GAMES, DANCING, AND OPEN CONTAINERS

Visit the Red Hat booth in Hall D for location and invitation.

An invitation doesn't guarantee entrance. Admission determined by city of Boston fire code.

- Introductions
- JBoss Fuse Overview
- JBoss Data Virtualization Overview
- Demo Time

Agenda

Camel components to integrate JBoss Fuse with JBoss Data Virtualization

JBoss Fuse Overview

#redhat #rhsummit

JBoss Fuse Overview

- Apache project originally created by Fusesource
- Karaf OSGi container
- Camel mediation framework for connectivity and transformation
- Active MQ messaging
- Apache CXF services
- Provides support for over 150 protocols for integration through Camel Components
- Provides EIP via Camel Processors to transform and route messages based on the Hohpe & Wolfe 'Enterprise Integration Patterns'
- De Facto standard for enterprise integration

JBoss Fuse Architecture

Windows, UNIX, and other Linux

JBoss Fuse – Includes Apache Camel

JBoss Data Virtualization Overview

JBoss Data Virtualization Overview

- Enterprise implementation of the Teild project
- Allows data virtualization of large set of data sources
- RDBMS via JDBC & ODBC
- Files, Web Services, RESTful services, NoSQL, Data Grid, SAP, and others • Client exposure via JDBC, ODBC, SOAP, REST
- Preserves 'in place' data via native queries to underlying datasources
- Data modeling through Teiid Designer Eclipse plugin
- RBAC to virtual models that expose controlled slices of physical data
- Caching of result sets, code tables using Infinispan
- Caching of views as Materialized Views through single click configuration in Teild Designer

Camel Components to Integrate Fuse with JDV

#redhat #rhsummit

Fuse-Data Virtualization Architecture

Camel JDBC Component

- Allows JDBC access to a database
- SQL queries and operations are passed in the message body
- Producer endpoints only
- URI format → jdbc:datasourcename[?options]
- Options to configure the query
- Results returned as ArrayList<HashMap<String, Object>> in OUT body of message
- List entries for each row returned
- Map String=ColumnName, Object=ColumnValue

Camel JDBC Route

Camel SQL Component

- Also allows JDBC access to databases
- Uses spring-jdbc 'under the covers'
- Query is defined in the URI to the endpoint
- URI \rightarrow sql:select * from table where id=:#myId order by name[?options]
- Named parameters in message body passed as java.util.Map in message body or in as named parameters in the message header
- Query results returned as List<Map<String, Object>> in the message body
- Update operation return Integer in the message body for the count of rows affect
- Easy, peasy
 from("jms:order.inbox")

.to("sql:select order_seq.nextval from dual? outputHeader=OrderId&outputType=SelectOne")

.to("jms:order.booking");

Camel SQL Route

Camel Olingo2 Component

- Available in Camel 2.14
- The Olingo2 component utilizes Apache Olingo version 2.0 API's to interact with OData 2.0 and 3.0 component service
- URI format olingo2://endpoint/<resource-path>?[options]
- Will be part of JBoss Fuse 6.2
- Easy integration with Data Virtualization

Camel Olingo2 Route

Camel Jetty Component

- HTTP requests
- the Jetty component behaves as a simple Web server, or
- Jetty can also be used as a http client, or Camel producer
- URI format jetty:http://hostname[:port][/resourceUri][?options]

• The jetty component provides HTTP-based endpoints for consuming and producing
